CounterCultureData Documentation

CounterCultureData software will help workers at Counter Culture Coffee automatically insert data from the machines into Google Sheets. The software has a built-in stopwatch to keep track of machine running duration. Workers will input data such as weight and SKU. The software will populate the Google Sheets with the inputted data and calculate machine production weight.

The software is written in Google Apps Script , HTML, Javascript, and CSS. Bootstrap was used for styling.

Google Sheets - 6

Software Access

On devices that will be used to access CounterCultureData, all other Google accounts must be signed out. The only Google account that should be signed in is CounterCultureData.

Login Credentials:
Email: REDACTED
Password: REDACTED

Front End

The same link for the software's front-end will be used on all devices. Note that you must sign in with the above credentials.

Most up do date link as of 05/01/2020:
REDACTED

Google Sheets

The software is connected to a Google Sheets project titled 'CounterCultureCoffee'. This can be found in Google Drive as well. This Google Sheet will store all of the software's data.

Must up to date link as of 04/12/2020:
REDACTED

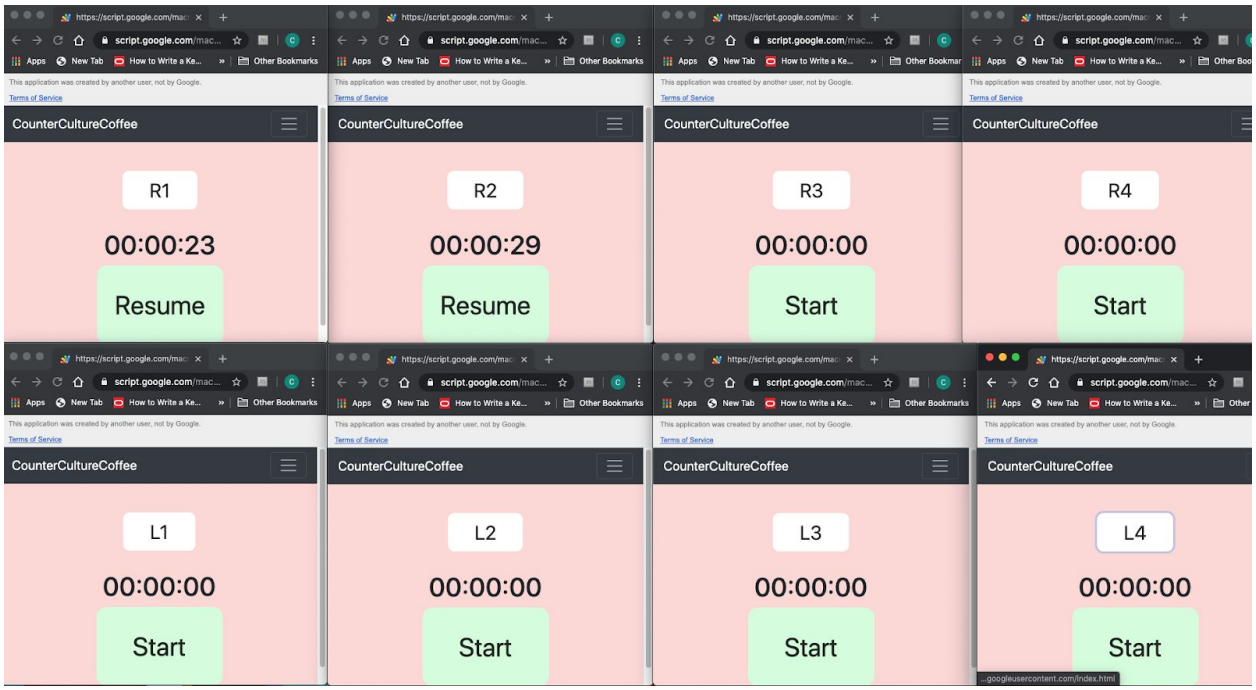
Workers should only be accessing and manipulating 'CounterCultureCoffee' Google Sheets project. There is a 'CounterCultureDev' which is for developers only.

Suggested Setups

Any device will successfully run the application. The preferred web browser is Google Chrome. However, any other browser should work as well.

Important: All devices must be set up as to not sleep or close. If the device closes, the stopwatch will stop working and data will be lost.

Setup 1: Single device station.



A single laptop with multiple browsers open. Each browser is set to a different machine. Workers will have to go to the station to use the software. A large monitor is STRONGLY preferred to fit all the browsers.

Setup 2: Tablet stations

Each machine has a tablet with its respective software opened. Workers can conveniently interact with the software at their stations.

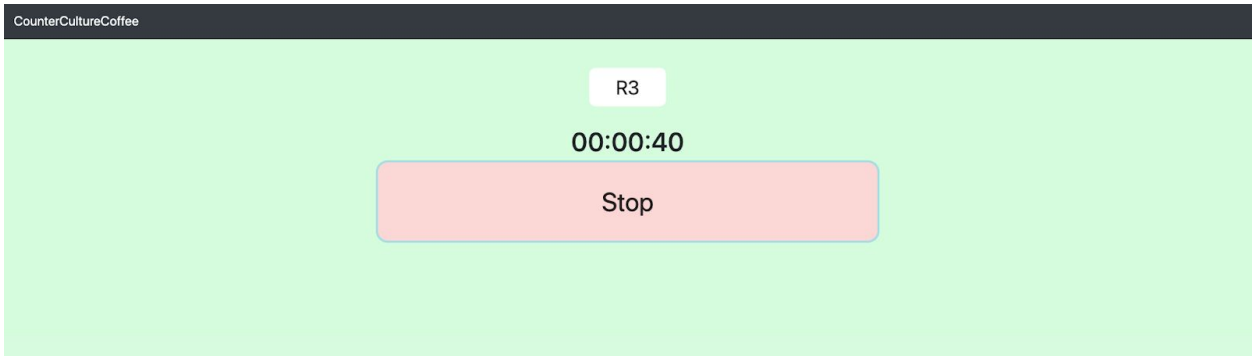
Front End

Toggle between machines

Users will press the white button that will toggle between the various machines. The order of toggles is as follows: R1, R2, R3, R4, L1, L2, L3, L4, Matrix. Workers should toggle to the machine they are on. For our example, let's say that the worker is on roast machine 3, R3.

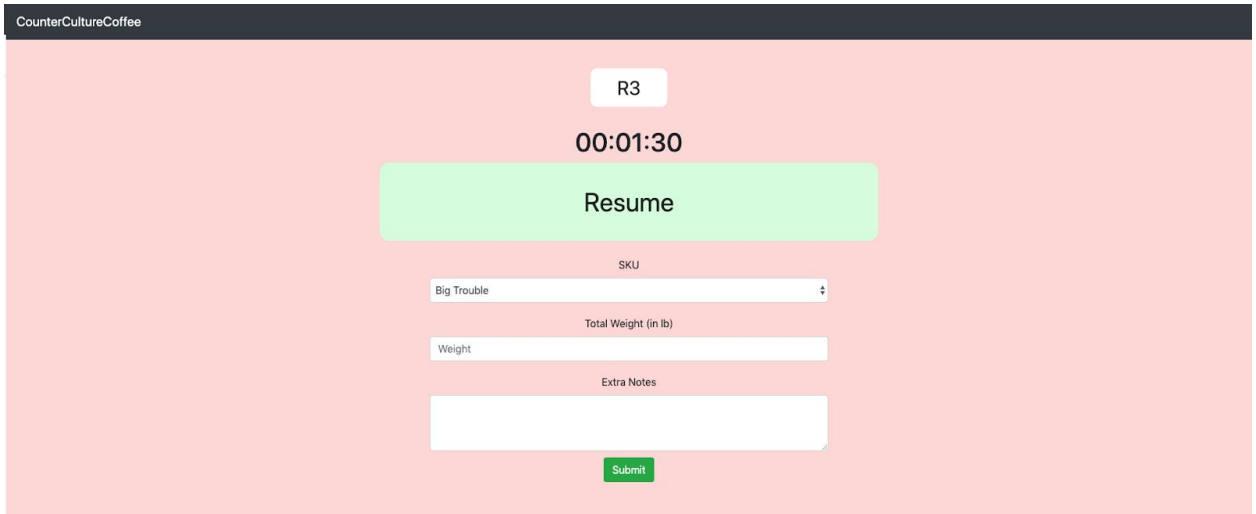
Start the machine

Press the 'Start' button on the website after you start your machine. The stopwatch should begin and the screen will turn green.



Stop the machine

Press the ‘Stop’ button on the website whenever the machine is stopped. Multiple input fields should appear for the user to fill out. The user should fill in SKU, **green weight**, and extra notes.



Note that if the user had paused the machine, or had accidentally pressed stop, the user can click ‘Resume’ to resume the stopwatch.

Submit

Once the user has filled out all input fields, press the ‘Submit’ button. Once the ‘Submit’ button is pressed, the data is populated into Google Sheets. The software will reset to initial state. **Note that there will be no alert saying that it was submitted. The software will simply reset after submission.**

Google Sheets

Global Tally | R1 | R2 | R3 | R4 | L1 | L2 | L3 | L4 | Matrix

The order of the sheets shown above **must remain the same** for the software to work. The data will be printed to the incorrect sheets if the order is incorrect.

Roasting Machines (R1 - R4)

Date	SKU	Start	End	Duration	Weight	Throughput	Notes	Total Duration	Total Weight	Overall Throughput
04/11/2020	SOs	21:37:04	21:37:06	0:00:02	880	1584000	This is SOs	0:00:18	1760.44	792198
	Fast Forward	21:37:29	21:37:33	0:00:03	870	1044000	Fast Forward			
	Fast Forward	11:59:17	11:59:24	0:00:06	10.44	6264	Extra Notes			
04/12/2020	Apollo	12:03:48	12:03:52	0:00:04	10.44	9396	NOTES			

The column order must remain the same. Data in the roasting machines will be populated vertically downwards. The order of columns is shown above. Entries that are on the same day will only show the date for the first entry. In the example above, the first 3 entries are on 4/11/2020. On the last entry of the day, the total duration, total weight, and overall throughput will be calculated for the day.

Duration is calculated by *End - Start*

NOTE: The weight in Google Sheets is post-roast weight, not the green weight.
Weight Calculations by SKU:

- SOs: Weight = Green Weight * .88
- Others: Weight = Green Weight * .87

Throughput Calculation: Weight / Duration (hours)
Colors will indicate how well the machines are performing relative to the machine's standards.

Bagging Machines (L1 - L4 & Matrix)

A	B	C	D	E	F	G	H
Date	**SKU**	**Start**	**End**	**Duration**	**Bags (12 oz)**	**Throughput**	**Notes**
04/12/2020	Big Trouble	21:15:20	21:15:21	0:00:01	212	763200	Notes

The column order must remain the same. Data is populated vertically downwards. Entries that are on the same day will only be shown once. For machines L1 - L4, the entry is the number of 12 oz bags. In Matrix, the entry is the number of 5 oz bags.
